

DAGGER RISERS

Dagger risers are initially installed with specific tooling. Due to potential damage of risers, **disassembly is strongly discouraged.**

If running wires through carbon fiber tubes, de-pinning wire connectors will be necessary. Otherwise, the hole in the bottom of the midsection can be used to run wires.

There **WILL** be a **SMALL GAP** after top clamp is torqued to 6 ft. lbs. The tightening pattern is meant to make sure that the gap is even across the top of the riser.
